## Carbohydrates :-

- Carbohydrates are complex biochemical structures that serve vital functions in the human body.
- Composed of a building block of sugar, they are the main source of energy for the body.
- They are many types of Carbohydrates. One or more sugars will link together to form carbohydrates of different types.
- Complex carbohydrates consists of thousands of repeating sugar units and are the major constituent of starch.
- Nucleotides such as DNA are also composed of carbohydrates.
- poly hydroxy aldehydes or poly hydroxy - ketones of formula  $(C_5H_{10}O)_n$
- And are usually classified according to their structure;

Monosaccharides :- Simple sugars with multiple OH groups. Based on number of carbons (3, 4, 5, 6), a monosaccharide is a triose, tetrose, pentose or hexose, cannot be hydrolyzed to simple carbohydrates; eg:- Glucose or fructose.

Disaccharides :- 2 monosaccharides covalently linked can be hydrolyzed into two monosaccharide unit; eg:- sucrose, which is hydrolyzed into glucose and fructose.

Oligosaccharides - a few monosaccharides covalently linked.

Polysaccharides :- polymers consisting of chains of monosaccharides & disaccharide units.

Eg:- Starch & cellulose.

Amino acid :-

→ An amino acid is an organic chemical. Organic chemicals contain carbon-hydrogen bonds.

→ All amino acids have the same basic structure.

→ Each molecule has a central carbon atom linked together with a basic amino group, a carboxylic acid group, a hydrogen atom and an R-group, or side chain group.

→ The chemical formula of amino acid is  $R-CH(NH_2)-COOH$  and its molecular weight is 110Da (Dalton).

→ It consists of a basic amino group ( $-NH_2$ ) and an acidic carboxyl group ( $-COOH$ ) along with an organic R group (side chain) which is unique in each amino acid.

→ The essential amino acids are very important for many metabolic processes within the body.

→ They are needed to produce other non-essential amino acids, and they are also involved in processes such as gene regulation and ATP generation.
