SOLAR WATER HEATER

The secretary and correspondent of SPACES Degree College supports renewable energy sources. As a result, solar water heaters are installed on the rooftops of the structures. The solar water heaters use the sun's heat raise the water's temperature. Thus, the SPACES Degree College has contributed to the reduction of atmospheric carbon emissions.

Mineral Water Plant

The college has its own water treatment facility on campus. Reverse osmosis (RO) process is used in water purification. Ions, unwanted molecules and larger particles are separated from the water. The RO process removes negligible amounts of calcium and harmful nitrates. The existing plant on the campus supplies 1500 litres of water per day fit for drinking. The waste water generated by the water treatment plant is diverted to plants and crops. The campus has an excellent water management system in place.

VERMI COMPOST

The campus has a vermicomposting unit. Vermicompost is a type of compost that is produced by using worms to breakdown organic waste materials such as food scraps, yard waste, and other bio-degradable materials. The resulting compost is rich in nutrients and beneficial microorganisms, making it an excellent soil amendment for plants.

Some of the uses of vermicompost include:

1. Improves soil health, increase water retention, and provide essential nutrients to plants.
2. The nutrients and microorganisms in vermicompost can help plants grow stronger and healthier, leading to better yields and more robust plants.
3. Vermicomposting is an excellent way to reduce the amount of organic waste that ends up in landfills, which can help reduce greenhouse gas emissions and other environmental impacts.
4. By using vermicompost instead of synthetic fertilizers, farmers can reduce their reliance on non-renewable resources and support more sustainable agricultural practices.

BIO-DIGESTERS

Biogas is generated through six plants constructed on the premises of the institution. Both cattle dung and urine are connected to these biogas plants through a canal system. After permutation, the biogas generated is connected to the kitchen through a tube and utilised by stoves specially designed for the purpose. As far as the lighting system is concerned, the biogas supplies are connected to a diesel unit which generates power to the tune of 200 units per day, resulting in savings on the energy bill. Besides, the institution also saves, on average, four 18.2 kg LPG per day on cooking. Apart from this, the slurry available after permutation of cow dung is being used as an organic fertiliser for various agriculture purposes including farming, on the premises. The excess slurry is also supplied to farmers who opt for organic farming.

AYURVEDIC HOSPITAL

Ayurveda is our wealth, contributed by the Indian saints since ancient days and developed by the philanthropic families of Kerala State. Inspired by the selfless services rendered to the Indian society and the citizens of the world at large by the ayurvedic tradition and the pressing need to revive our age old Ayurvedic Vaidya practices for developing a strong and healthy Indian society, we decided to popularise the noble ayurvedic vaidya and its importance specially to cater to the needs of young students and poor villagers.

We have started the Sri Prakash AYUSH Charitable and Research Trust to needs of our in-house students as well as poor people living in the surrounding villages and the trust started its operations on April 2018 and is providing ayurvedic services to inmates of Sri Prakash Schools as well as patients from surrounding places. The trust is registered on July 09, 2018 in the Join Sub Registrar's office, Kakinada, wide CS No. 32/2018 doc. No. 30/2018.
